But it is quite evident that Hickman's has vastly understated the amounts of ammonia being released. These reported ammonia releases ignore releases from the three-story barns' vents and 84' wide openings on their east sides and the ammonia released when the manure is dried in the rotary dryers.

Looks like I misread the forms filed by Hickman's, and that the HF and HCL releases are boilerplate language on the forms to be used as an example of how to fill out the forms.

Sorry for the false alarm.

Hickman Family Farms

So Hickman's has finally admitted it has had ammonia releases all these years. The reporting of Hydrogen Chloride and Hydrogen Fluoride were not anticipated to be disclosed, however. This is a very significant development. Hydrogen Fluoride is a very dangerous chemical, with a 100 lb reportable quantity. This is the chemical that was later found to have been released in the QPC fire that was suspected of killing all the pets and the people. Arlington Elementary is three miles to the west of the Hickman's Arlington facility.

I am wondering if the risks from all these releases of all hazardous substances will be calculated and investigated properly, but the known risks to the public have certainly expanded. Also, I don't believe the ammonia calculations are correct, as they are below what our expert had calculated and even ADEQ.

I am requesting EPA examine this new information and respond.

Good morning, Steve.

Here are the documents you were awaiting. Just so you know, ADEQ has not reviewed these reports yet.

Thank you,

Lolee Tolson
